

Haiti

Human Capital Index 2020

This brief provides an update to the Human Capital Index (HCI). First launched in 2018, the HCI measures the amount of human capital that a child born today can expect to attain by age 18. It conveys the productivity of the next generation of workers compared to a benchmark of complete education and full health. Worldwide a child born in 2020 can expect, on average, to be 56 percent as productive as she could be when she grows up. All data represent the status of countries pre-COVID-19.

THE HUMAN CAPITAL INDEX

Human Capital Index. A child born in Haiti today will be **45 percent** as productive when she grows up as she could be if she enjoyed complete education and full health. This is lower than the average for Latin America & Caribbean region but higher than the average for Low income countries.

- **Probability of Survival to Age 5.** **94** out of 100 children born in Haiti survive to age 5.
- **Expected Years of School.** In Haiti, a child who starts school at age 4 can expect to complete **11.4 years** of school by her 18th birthday.
- **Harmonized Test Scores.** Students in Haiti score **338** on a scale where 625 represents advanced attainment and 300 represents minimum attainment.
- **Learning-adjusted Years of School.** Factoring in what children actually learn, expected years of school is only **6.1 years**.
- **Adult Survival Rate.** Across Haiti, **78 percent** of 15-year olds will survive until age 60. This statistic is a proxy for the range of health risks that a child born today would experience as an adult under current conditions.
- **Healthy Growth (Not Stunted Rate).** **78** out of 100 children are **not** stunted. **22** out of 100 children are stunted, and so are at risk of cognitive and physical limitations that can last a lifetime.

DIFFERENCES IN HCI ACROSS GENDER AND SOCIO-ECONOMIC GROUPS

In Haiti, the HCI for girls is higher than for boys. Table 1 shows gender disaggregation for each of the HCI components.

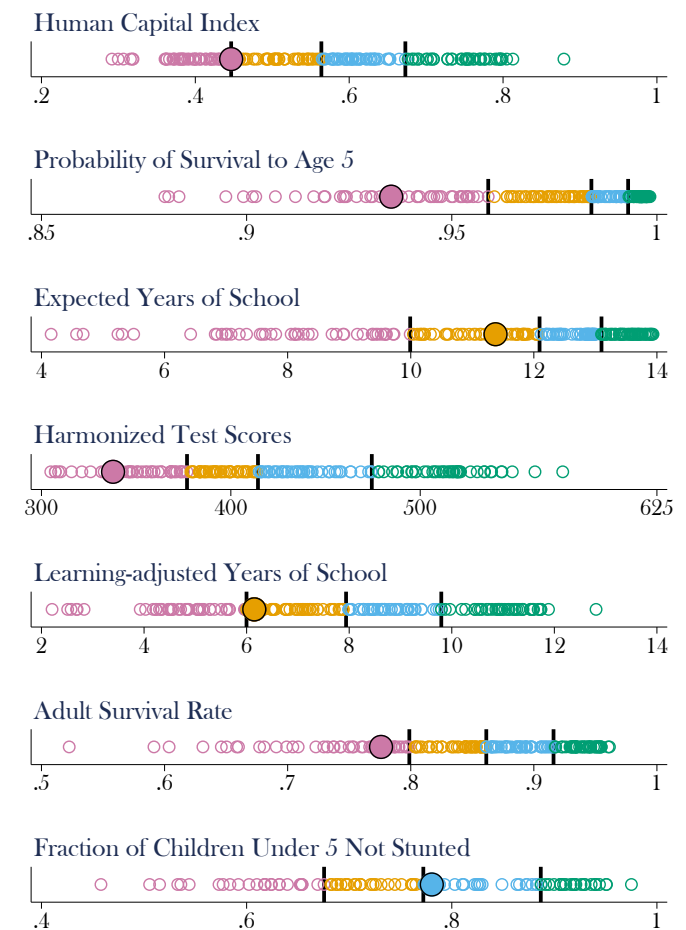

The ratio in HCI between the richest and poorest 20 percent of the population in Haiti is **1.28** (global average: 1.35; global range: 1.12-1.68).

Table 1. HCI by Gender and Socio-economic Group

Component	Boys	Girls	Overall
HCI	0.43	0.46	0.45
Survival to Age 5	0.93	0.94	0.94
Expected Years of School	11.3	11.4	11.4
Harmonized Test Scores	333	342	338
Learning-adjusted Years of School	6.0	6.3	6.1
Adult Survival Rate	0.75	0.81	0.78
Not Stunted Rate	0.76	0.80	0.78
HCI Ratio (richest / poorest 20 percent)			1.28
