Human Capital Index 2020

This brief provides an update to the Human Capital Index (HCI). First launched in 2018, the HCI measures the amount of human capital that a child born today can expect to attain by age 18. It conveys the productivity of the next generation of workers compared to a benchmark of complete education and full health. Worldwide a child born in 2020 can expect, on average, to be 56 percent as productive as she could be when she grows up. All data represent the status of countries pre-COVID-19.

THE HUMAN CAPITAL INDEX

Human Capital Index. A child born in Vietnam today will be **69 percent** as productive when she grows up as she could be if she enjoyed complete education and full health. This is higher than the average for East Asia & Pacific region and Lower middle income countries. Between 2010 and 2020, the HCI value for Vietnam increased from 0.66 to 0.69. Figure 1 shows how the HCI and each of the components evolved over time.

- **Probability of Survival to Age 5.** 98 out of 100 children born in Vietnam survive to age 5.
- **Expected Years of School.** In Vietnam, a child who starts school at age 4 can expect to complete **12.9 years** of school by her 18th birthday.
- **Harmonized Test Scores.** Students in Vietnam score **519** on a scale where 625 represents advanced attainment and 300 represents minimum attainment.
- **Learning-adjusted Years of School.** Factoring in what children actually learn, expected years of school is only **10.7 years**.
- **Adult Survival Rate.** Across Vietnam, **87 percent** of 15-year olds will survive until age 60. This statistic is a proxy for the range of health risks that a child born today would experience as an adult under current conditions.
- **Healthy Growth (Not Stunted Rate).** 76 out of 100 children are **not** stunted. 24 out of 100 children are stunted, and so are at risk of cognitive and physical limitations that can last a lifetime.

DIFFERENCES IN HCI ACROSS GENDER AND SOCIO-ECONOMIC GROUPS

In Vietnam, the HCI for girls is higher than for boys. Table 1 shows gender disaggregation for each of the HCI components.

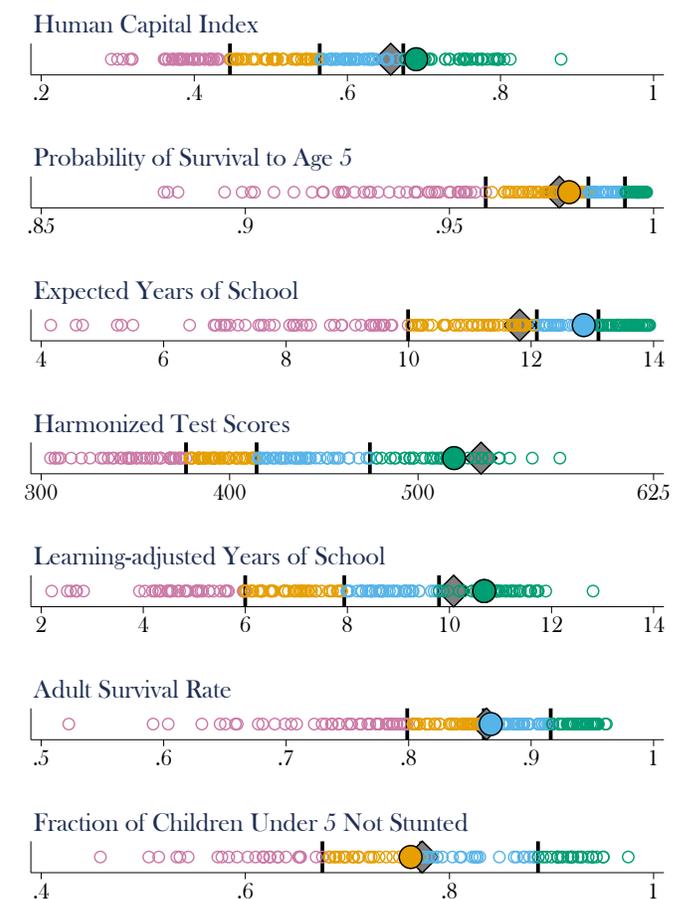

The ratio in HCI between the richest and poorest 20 percent of the population in Vietnam is **1.47** (global average: 1.35; global range: 1.12-1.68).

Table 1. HCI by Gender and Socio-economic Group

Component	Boys	Girls	Overall
HCI	0.65	0.73	0.69
Survival to Age 5	0.98	0.98	0.98
Expected Years of School	12.5	13.2	12.9
Harmonized Test Scores	514	524	519
Learning-adjusted Years of School	10.3	11.0	10.7
Adult Survival Rate	0.81	0.92	0.87
Not Stunted Rate	0.75	0.77	0.76
HCI Ratio (richest / poorest 20 percent)			1.47
