The Human Capital Index (HCI) measures the amount of human capital that a child born today can expect to attain by age 18. It conveys the productivity of the next generation of workers compared to a benchmark of complete education and full health. It is constructed for 157 countries.

It is made up of five indicators: the probability of survival to age five, a child’s expected years of schooling, harmonized test scores as a measure of quality of learning, adult survival rate (fraction of 15-year olds that will survive to age 60), and the proportion of children who are not stunted.

Globally, 56 percent of all children born today will grow up to be, at best, half as productive as they could be; and 92 percent will grow up to be, at best, 75 percent as productive as they could be.

What is the state of human capital in Malawi?

- **Human Capital Index.** A child born in Malawi today will be 41 percent as productive when she grows up as she could be if she enjoyed complete education and full health.

- **Probability of Survival to Age 5.** 94 out of 100 children born in Malawi survive to age 5.

- **Expected Years of School.** In Malawi, a child who starts school at age 4 can expect to complete 9.4 years of school by her 18th birthday.

- **Harmonized Test Scores.** Students in Malawi score 359 on a scale where 625 represents advanced attainment and 300 represents minimum attainment.

- **Learning-adjusted Years of School.** Factoring in what children actually learn, expected years of school is only 5.4 years.

- **Adult Survival Rate.** Across Malawi, 73 percent of 15-year olds will survive until age 60. This statistic is a proxy for the range of fatal and non-fatal health outcomes that a child born today would experience as an adult under current conditions.

- **Healthy Growth (Not Stunted Rate).** 63 out of 100 children are not stunted. 37 out of 100 children are stunted, and so at risk of cognitive and physical limitations that can last a lifetime.

Are there gender differences in HCI?

In Malawi, lack of data prevents comparison of HCI by gender. Table 1 shows gender disaggregation for each of the HCI components, where available.

<table>
<thead>
<tr>
<th>Component</th>
<th>Boys</th>
<th>Girls</th>
<th>Overall</th>
</tr>

<td>Not Stunted Rate</td>
<td>0.61</td>
<td>0.64</td>
<td>0.63</td>
</tr>
</tbody>
</table>

Note:
- When shown, hyphen denotes data are unavailable
- All values are rounded
- The gender-disaggregated HCI is calculated using only adult survival rates if gender-disaggregated stunting data is not available.
HOW DOES MALAWI COMPARE?

In 2017, Malawi’s HCI is slightly higher than the average for its region and higher than the average for its income group.

HOW MUCH ARE CHILDREN ACTUALLY LEARNING IN SCHOOL?

Children in Malawi can expect to complete 9.4 years of pre-primary, primary and secondary school by age 18. However, when years of schooling are adjusted for quality of learning, this is only equivalent to 5.4 years: a learning gap of 4 years (Figure 3).

IS MALAWI'S HCI IN LINE WITH WHAT IS PREDICTED FOR ITS INCOME LEVEL?

In 2017, the HCI for Malawi is higher than what would be predicted for its income level (Figure 4).

THE HUMAN CAPITAL PROJECT

The Human Capital Project seeks to raise awareness and increase demand for interventions to build human capital. It aims to accelerate better and more investments in people. The Project has three elements (i) the Human Capital Index, (ii) a program to strengthen research and measurement on human capital; and (iii) support to countries to accelerate progress in raising human capital outcomes.

For more information on the Human Capital Project please visit www.worldbank.org/humancapitalproject
