Brazil's 2014-16 recession ended an eleven-year streak of poverty reduction. Recently released data show that it has disproportionately affected the poorest Brazilians – and an uneven recovery means that millions of Brazilians remain worse off than they were before the crisis. Between 2014 and 2016, over 5.6 million Brazilians fell into poverty (defined as living on less than $5.50 per day in 2011 PPP terms) as poverty increased from 17.7 percent to 20.1 percent. The number living on less than $1.90 per day 2011 PPP increased by over 2.5 million to surpass 8 million. While the recovery began in 2017, the number of Brazilians living on less than $1.90 continued to grow, reaching 9.3 million by 2018. Poverty rates at the $5.50 line, on the other hand, began to recover marginally in 2018 as 600,000 Brazilians exited poverty.

As of 2018, the recovery had yet to reach the poorest. In real terms, the average income of the poorest 40 percent was lower in 2018 than it had been in 2013, having fallen at an annualized rate of 0.5 percent, even as the average income grew at a rate of 0.33 percent per year during the same period. With significant income disruptions especially for informal and own-account workers, the COVID-19 pandemic is expected to increase poverty in 2020. As policies are implemented to mitigate its impact, it is crucial to consider the already weakened position of Brazil's poorest 40 percent.

The crisis, and to a lesser degree the uneven recovery, has led to a significant rise in income inequality: the Gini index increased from 51.9 in 2015, already one of the highest in the region, to 53.3 in 2016. By 2018, it reached 53.9, higher than it had been in 2012. A decomposition analysis suggests that if growth had been evenly distributed, poverty would have fallen during this period.

Unemployment is the primary culprit behind increased poverty and inequality. Rates increased significantly from 6.5 percent in the fourth quarter of 2014 to 13.7 in the first quarter of 2017. As of the last quarter of 2019, unemployment was at 11.0 percent. Rates are higher for youth (23.8 percent for 18-24 age group), for women than for men (13.1 and 9.2 percent respectively), and for those with less schooling (18.5 percent for those with incomplete secondary and 5.6 for those with tertiary education).

POVERTY DATA AND METHODOLOGY

To make meaningful international comparisons, poverty is calculated using the same methodology across countries, that is, using the same consumption or income aggregate and poverty line. For this purpose, the World Bank publishes poverty rates calculated using three poverty lines: $1.90, $3.20, and $5.50 per person per day, in 2011 PPP terms. Brazil does not have an official poverty methodology, but the National Statistical Office (IBGE) has published national poverty rates based on several administrative and international lines.

The household survey used to calculate poverty since 2001, the PNAD, was recently replaced by the PNAD-Continua (PNADC). These two surveys are not strictly comparable. This limits the extent to which poverty and inequality dynamics before and after 2012 can be analyzed.

HARMONIZATION

The numbers presented in the brief are based on the regional data harmonization effort known as the Socio-economic Database for Latin America and the Caribbean (SEDLAC) - a joint effort of the World Bank and CEDLAS from the National University of La Plata (Argentina). SEDLAC includes 18 countries and more than 300 household surveys since the 80s. Several Caribbean countries have not been included in the SEDLAC project due to lack of data. Since an income-based welfare aggregate is widely used in the region for official poverty estimates, income-based microdata is used for the Global Monitoring Database (GMD) and Global Poverty Monitoring. SEDLAC covers demographics, income, employment, and education. Terms of use of the data adhere to agreements with the original data producers.
