

Poverty & Equity Brief

Africa Eastern & Southern

Zimbabwe

April 2021

The latest household survey data suggest that poverty is rising rapidly. Between 2011 and 2017 extreme poverty – using the national extreme poverty line equivalent to 2011 PPP US\$ 1.83 per day - rose from 23 to 30 percent. It then increased further to 38 percent in April-May 2019, with urban poverty rising faster in relative terms (from 4 percent to 10 percent) than rural poverty (43 to 51 percent). Simulations of the impact of rapid price rises and poor crop yields in 2019 suggest extreme poverty is likely to have increased to 42 percent in the whole of 2019. Welfare inequality, as measured by the Gini index has risen from 43 in 2011/12 to 45 in 2017 and 50 in April-May 2019. Extreme poverty has traditionally been high in remote and poorly connected but densely populated rural areas where agricultural conditions are not optimal. These form severe spatial poverty traps.

The rise in extreme poverty during 2017-2019 was largely driven by the economic crisis and exacerbated by poor rains during the 2018/2019 growing season and cyclone Idai. This has led to a deterioration of household incomes in both rural and urban areas. About 5.6 million people were estimated to be extremely poor in April/May 2019 compared to 4.5 million in 2018.

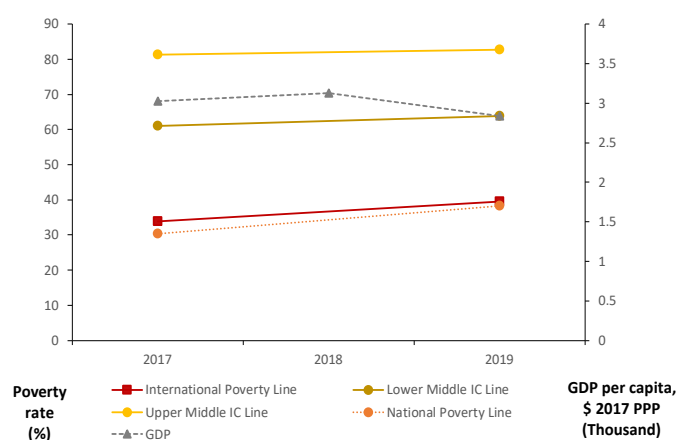

Poverty in Zimbabwe is largely a rural phenomenon, but the COVID-19 pandemic has impacted urban areas relatively more. According to the first round of the PICES rapid telephone survey, 18 percent of those in urban areas that were working for pay before the COVID-19 pandemic were no longer working in June-July 2020, compared to 10 percent in rural areas. In August 2020, 16 percent of household businesses were temporarily closed and 58 percent of open businesses had lower or no revenue from sales. Food security problems also worsened due to another poor rainy season, rising food prices and shrinking incomes. Staples such as maize meal, cooking oil, and chicken remain out of reach for many households. The coverage of COVID-19 relief assistance expanded slightly between July and August 2020, but the overall coverage remains low, especially in rural areas.

COVID-19 has also disrupted service delivery. School closures have disproportionately impacted learning in rural areas as only a quarter of children was able to continue to engage in learning activities, compared to 70 percent in urban areas. Supply-side challenges facing the health system have contributed to a decline in the coverage and quality of essential health services. During August 2020, a quarter of households that were prescribed medicine due to an illness were unable to obtain it.

POVERTY	Number of Poor (million)	Rate (%)	Period
National Poverty Line	5.6	38.3	2019
International Poverty Line 1 in U.S. dollar (2019) or US\$1.90 (2011 PPP) per day per capita	5.8	39.5	2019
Lower Middle Income Class Poverty Line 1.7 in U.S. dollar (2019) or US\$3.20 (2011 PPP) per day per capita	9.3	63.8	2019
Upper Middle Income Class Poverty Line 3 in U.S. dollar (2019) or US\$5.50 (2011 PPP) per day per capita	12.1	82.8	2019
Multidimensional Poverty Measure		41.7	2019
SHARED PROSPERITY			
Annualized Consumption Growth per capita of the bottom 40 percent		-3.75	2011-2017
INEQUALITY			
Gini Index		50.3	2019
Shared Prosperity Premium = Growth of the bottom 40 - Average Growth		-0.25	2011-2017
GROWTH			
Annualized GDP per capita growth		2.86	2011-2017
Annualized Consumption Growth per capita from Household Survey		-3.50	2011-2017
MEDIAN INCOME			
Growth of the annual median income/consumption per capita		-4.54	2011-2017

POVERTY DATA AND METHODOLOGY

Household expenditure surveys were conducted in 1995, 2001, 2011, and 2017, while a rapid expenditure survey, using SWIFT methodology, was conducted in April-May 2019. A high-frequency phone survey was initiated in June 2020 and a second round was completed in September which included the SWIFT methodology to update poverty estimates. A third round is expected to be completed in March, 2021.

Comparison of past official estimates of poverty should be treated with care, as there have been some changes in methodology, for example in the calculation of the user value of assets and housing. Poverty measurement was rebased in 2019 with close World Bank support, starting with the PICES 2017 survey. This involved adopting good practice approaches for measuring the consumption aggregate. It also led to the calculation of a new minimum food needs basket and new poverty lines. The rebasing only changed the poverty rates by 1-2 percentage points.

The official national general poverty line is the lower poverty line equivalent to PPP US\$ 3.5. The other two poverty thresholds in use are the upper poverty line (PPP US\$ 4.7) which adopts the upper ceiling of the basic need method and the national extreme poverty line corresponding to the food poverty line valued at about PPP US\$ 1.8 per day. Given that Zimbabwe is a lower-middle-income country that is only just above the low-income country threshold, the extreme and lower poverty lines are most relevant.

Zimbabwe amended its statistical law in January 2017 which allowed ZIMSTAT to release anonymized micro-data to researchers. Implementing regulations were adopted in August 2018 and the first set of micro-data was released towards the end of 2019. Several household surveys can now be downloaded from the ZIMSTAT website and are used for further analysis by national and international researchers.

HARMONIZATION

The numbers presented in this brief are based on the SSAPOV database. SSAPOV is a database of harmonized nationally representative household surveys managed by Sub-Saharan Team for Statistical Development. It contains more than 100 surveys covering 45 out of the 48 countries in the SSA region. The three countries not covered in the database are Eritrea, Equatorial Guinea, and Somalia. Terms of use of the data adhere to agreements with the original data producers.
