The official poverty rate in Russia has been slowly declining in recent years: from 12.6 percent in 2018, 12.3 percent in 2019 to 12.1 percent in 2020. At the same time, the poverty rate at US$5.5 (revised 2011 PPP) was estimated by World Bank Staff at 3.7 percent, 3.2 percent and 4.3 percent, respectively. Recent quarterly official poverty reached 14.4 percent and 13.1 percent in the first and second quarters of 2021. While the hike in poverty in the first quarter of 2021 is partly associated with a seasonal slowdown of economic activities, 2021 rates are not strictly comparable to the previous series because Rosstat adopted a new methodology in December 2020. The economy rebound in the second quarter of 2021 and scaling up the support to poor families with children contributed to poverty alleviation. World Bank staff estimates that the poverty rate under the US$5.5 poverty line will decrease to 3.5 percent in 2021.

In a May 2018 decree, Russia's president set up a target of halving the official poverty rate over the next six years. This pre-pandemic goal is unlikely to be attained. A new decree in July 2020 moves the goal of halving the poverty rate to year 2030 (from a baseline official poverty rate of 12.9 in 2017).

The relative income of those at the bottom of the distribution (called shared prosperity premium) experienced a slower decline in consumption than the rest of the population, as per most recent available data. On the back of an economic slowdown, the consumption growth of the overall population decelerated over the period 2013-2018 by 2.3 percent annually, while the consumption of the bottom 40 percent of the population also declined but at a smaller rate (0.4 percent), resulting in a positive shared prosperity premium.

Inequality in Russia remains relatively stable over recent years at levels that are, however, higher than in other ECA countries. The Gini index for consumption expenditures calculated by the World Bank for 2018 is 37.5, while the latest 2020 official estimates of the Gini index for incomes is at 40.6.
The official poverty estimates in Russia are produced by the Federal State Statistics Service (Rosstat) using data from the Household Budget Survey (HBS). HBS is conducted on a quarterly basis, and poverty rates (on a national level) are also published on a quarterly basis with some lag. Survey data for 2019 are already publicly available but too recently to be incorporated into this brief. Poverty rates are also available at a subnational level on an annual basis. The latest full year official estimates are for 2020.

Up until 2020, the official poverty rate was calculated as a share of population with per capita incomes below the poverty line, equivalent to the subsistence minimum level. The food component of the line was defined using a normative approach and is calculated for each year as the cost of a fixed basket using the price levels collected by Rosstat in a price survey. The total subsistence minimum is calculated as a food basket multiplied by two. Starting 2021, a new methodology has been adopted which defines the poverty line as 44.2 percent of the median income. Further details will follow in next PEB.

In 2020, the 2011 PPP was revised to take into account the effects of (i) national accounts rebasing, (ii) improvement of the underlying price data, (iii) regression of non-participating countries, and (iv) national accounts expenditure shares and relative prices between all of the countries in each comparison region. The revised 2011 PPP for the Russian Federation is 11.7 percent higher than the one based on the original PPP. Consequently, the poverty rate under the US$5.5 per day is adjusted from 2.3 percent to 3.7 percent in 2018.

HARMONIZATION

The numbers presented in this brief are based on the ECAPOV database. The ECAPOV micro database was established in 1998 to support a regional poverty report. The database is managed and harmonized by the Europe and Central Asia Team for Statistical Development (ECATSD). ECAPOV includes 29 countries, with an average of 8 surveys per country. Recently, EU-SILC data for EU countries, received from Eurostat, have been added to the collection. Each survey in ECAPOV is organized into 6 modules following the Global Monitoring Database (GMD) harmonization guidelines, including the construction of the welfare aggregate which is used for Global Poverty Monitoring. Terms of use of the data adhere to agreements with the original data producers.
